Normalization of Database

Database Normalization is a technique of organizing the data in the database. Normalization is a systematic approach of decomposing tables to eliminate data redundancy(repetition) and undesirable characteristics like Insertion, Update and Deletion Anamolies. It is a multi-step process that puts data into tabular form, removing duplicated data from the relation tables.

Normalization is used for mainly two purposes,

- Eliminating redundant(useless) data.
- Ensuring data dependencies make sense i.e data is logically stored.

The **video** below will give you a good overview of Database Normalization. If you want you can skip the video, as the concept is covered in detail, below the video.

Basic Concept of Database Normalization - Simple Explanation for Beginn...

Problems Without Normalization

If a table is not properly normalized and have data redundancy then it will not only eat up extra memory space but will also make it difficult to handle and update the database, without facing data loss. Insertion, Updation and Deletion Anamolies are very frequent if database is not normalized. To understand these anomalies let us take an example of a **Student** table.

rollno	name	branch	hod	office_tel
401	Akon	CSE	Mr. X	53337

Boyce-Codd Normal Form (BCNF) (boyce-codd-normal-form.php)

Fourth Normal Form (4NF) (fourth-normal-form.php)

SQL Concept

SQL Introduction (introduction-to-sql.php)

DDL Command

Create query (create-query.php)

Alter query (alter-query.php)

Truncate, Drop and Rename query (truncate-drop-rename-query.php)

DML Command

INSERT command (dml-command.php)

UPDATE command (dml-update-command.php)

DELETE command (dml-delete-command.php)

TCL Command

All TCL Command (tcl-command.php)

DCL Command

All DCL Command (dcl-command.php)

SELECT query (select-query.php)

WHERE clause (where-clause.php)

LIKE clause (like-clause.php)

ORDER BY clause (orderby-clause.php)

Group BY clause (groupby-clause.php)

Having clause (having-clause.php)

DISTINCT keyword (distinct-keyword.php)

AND & OR operator (sql-and-or-operator.php)

Advance SQL

SQL Constraints (sql-constraints.php)

SQL function (sql-function.php)

SQL Join (joining-in-sql.php)

SQL Alias (sql-alias.php)

SQL SET operation (set-operation-in-sql.php)

SQL Sequences (sql-sequences.php)

SQL Views (sql-views.php)

402	Bkon	CSE	Mr. X	53337
403	Ckon	CSE	Mr. X	53337
404	Dkon	CSE	Mr. X	53337

In the table above, we have data of 4 Computer Sci. students. As we can see, data for the fields branch , hod (Head of Department) and office_tel is repeated for the students who are in the same branch in the college, this is **Data Redundancy**.

Insertion Anomaly

Suppose for a new admission, until and unless a student opts for a branch, data of the student cannot be inserted, or else we will have to set the branch information as **NULL**.

Also, if we have to insert data of 100 students of same branch, then the branch information will be repeated for all those 100 students.

These scenarios are nothing but **Insertion anomalies**.

Updation Anomaly

What if Mr. X leaves the college? or is no longer the HOD of computer science department? In that case all the student records will have to be updated, and if by mistake we miss any record, it will lead to data inconsistency. This is Updation anomaly.

Deletion Anomaly

In our **Student** table, two different informations are kept together, Student information and Branch information. Hence, at the end of the academic year, if student records are deleted, we will also lose the branch information. This is Deletion anomaly.

Normalization Rule

Normalization rules are divided into the following normal forms:

- 1. First Normal Form
- 2. Second Normal Form
- 3. Third Normal Form
- 4. BCNF
- 5. Fourth Normal Form

First Normal Form (1NF)

For a table to be in the First Normal Form, it should follow the following 4 rules:

- 1. It should only have single(atomic) valued attributes/columns.
- 2. Values stored in a column should be of the same domain
- 3. All the columns in a table should have unique names.
- 4. And the order in which data is stored, does not matter.

In the next tutorial, we will discuss about the **First Normal Form** (first-normal-form.php) in details.

Second Normal Form (2NF)

For a table to be in the Second Normal Form,

1. It should be in the First Normal form.
2. And, it should not have Partial Dependency.

To understand what is Partial Dependency and how to normalize a table to 2nd normal form, jump to the **Second Normal Form** (second-normal-form.php) tutorial.

Third Normal Form (3NF)

A table is said to be in the Third Normal Form when,

1. It is in the Second Normal form.
2. And, it doesn't have Transitive Dependency.

Here is the **Third Normal Form** (third-normal-form.php) tutorial. But we suggest you to first study about the second normal form and then head over to the third normal form.

Boyce and Codd Normal Form (BCNF)

Boyce and Codd Normal Form is a higher version of the Third Normal form. This form deals with certain type of anomaly that is not handled by 3NF. A 3NF table which does not have multiple overlapping candidate keys is said to be in BCNF. For a table to be in BCNF, following conditions must be satisfied:

- R must be in 3rd Normal Form
- and, for each functional dependency ($X \rightarrow Y$), X should be a super Key.

To learn about BCNF in detail with a very easy to understand example, head to **Boye-Codd Normal Form** (boyce-codd-normal-form.php) tutorial.

Fourth Normal Form (4NF)

A table is said to be in the Fourth Normal Form when,

1. It is in the Boyce-Codd Normal Form.
2. And, it doesn't have Multi-Valued Dependency.

Here is the **Fourth Normal Form** (fourth-normal-form.php) tutorial. But we suggest you to understand other normal forms before you head over to the fourth normal form.
